

PUMP IT UP WITH VALVTECT MARINE FUELS

All fuels are not created equal. The same gas you pump into your car is not the same you want to use to fuel your Sea Ray. New changes that improve efficiency and reduce emissions for cars, like the introduction of ethanol-blended gasoline, can have unintended consequences for your marine engine. ValvTect Marine Fuels are the only fuels specially formulated for marine gasoline and diesel engines.

Ethanol has a tendency to absorb excess moisture around water, and long waits between fill-ups encourage this process of degradation. In extreme cases, a large amount of water in the tank can cause the ethanol to separate completely from the gasoline. Additionally, hotter-burning marine engines can accumulate excessive deposits, leading to a reduced power output (and therefore a more expensive gas bill) and potential damage. ValvTect Marine Gasoline contains a patented

Octane Performance Improver and marine-grade fuel additives not found in any automotive brands. These enhancements stabilize the fuel, keeping it fresh for up to a year and preventing octane loss. Additionally, a moisture dispersant helps eliminate the separation of ethanol and gasoline while special detergents prevent and clean up power-draining deposits. These changes add up to a healthy and powerful engine, greater fuel efficiency and less harmful exhaust emissions.

ValvTect Marine Gasoline and Premium Diesel are only available at Certified ValvTect Marinas that conform to a rigid certification process. **To learn more about ValvTect Marine Fuels and aftermarket additives, call (800) 728-8258 or visit www.valvtect.com.**
